Horizontal IoT Application Development using Semantics

Soumya Kanti Datta
Research Engineer
Communication Systems Department
Email: Soumya-Kanti.Datta@eurecom.fr

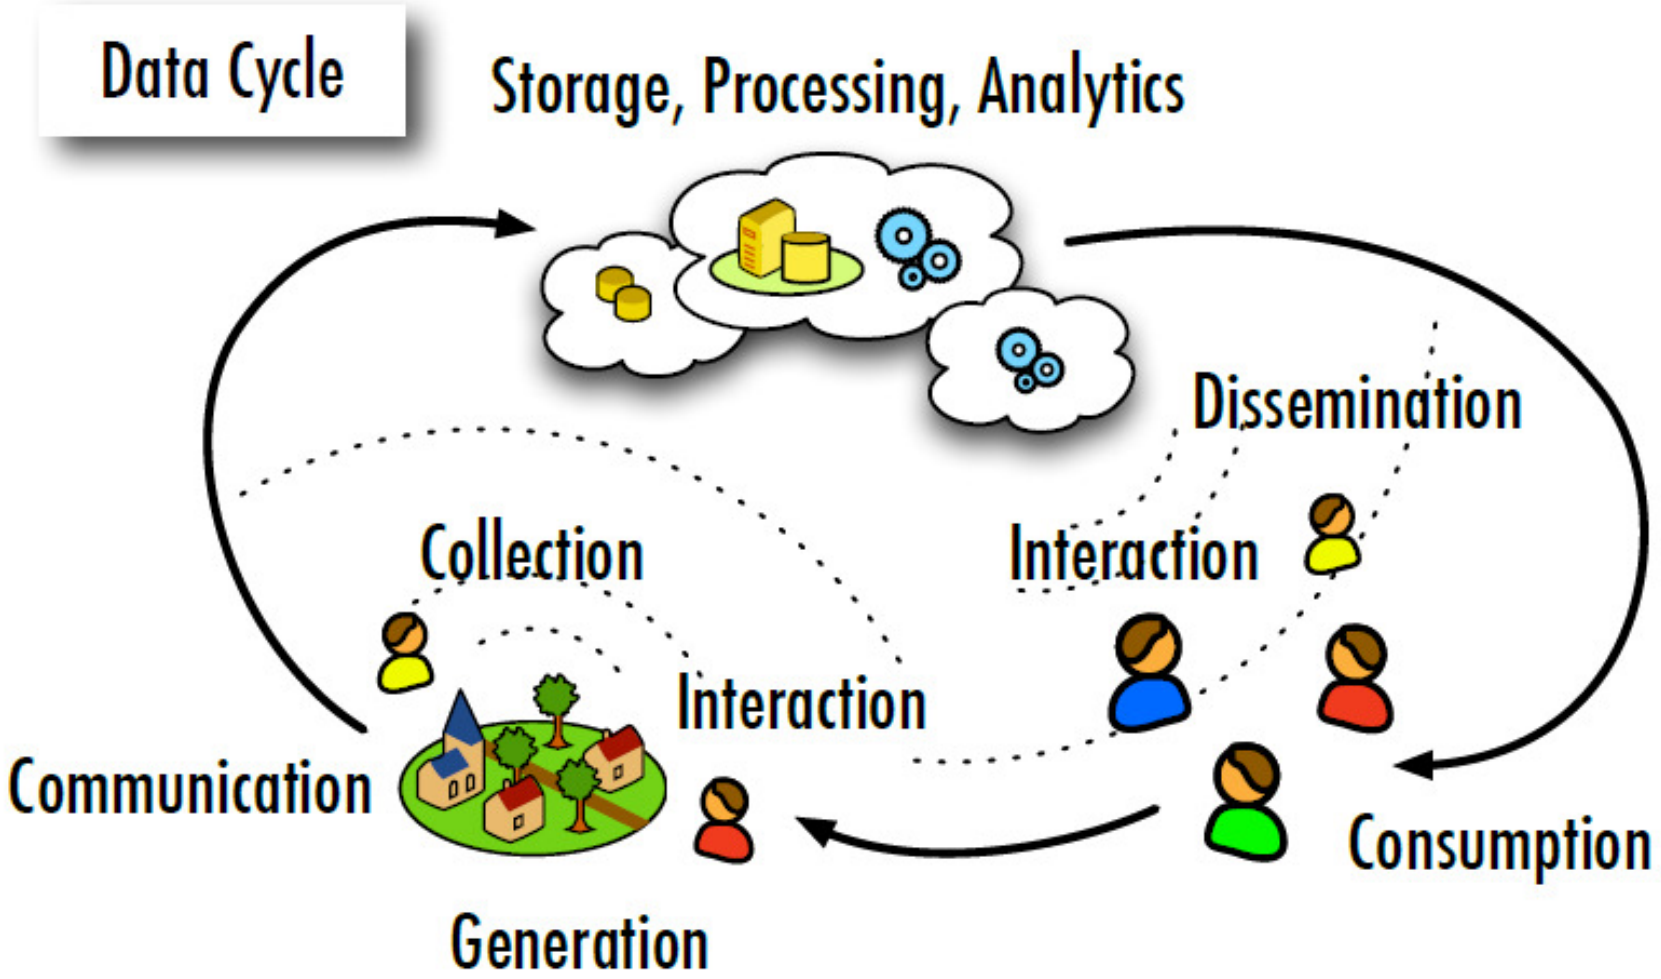
Roadmap

- **Introduction**
- **Challenges**
- **State-of-the-Art**
- **Horizontal IoT application development framework**
- **Conclusion**

Introduction - Ingredients

- Low-cost sensors, actuators, tags
- Networking chips
- Lightweight software development frameworks
- Low power communication protocols
- Growing trend of making everything “connected”
- Availability of cloud platform and smart devices
- New business opportunities

Data Cycle in IoT Applications



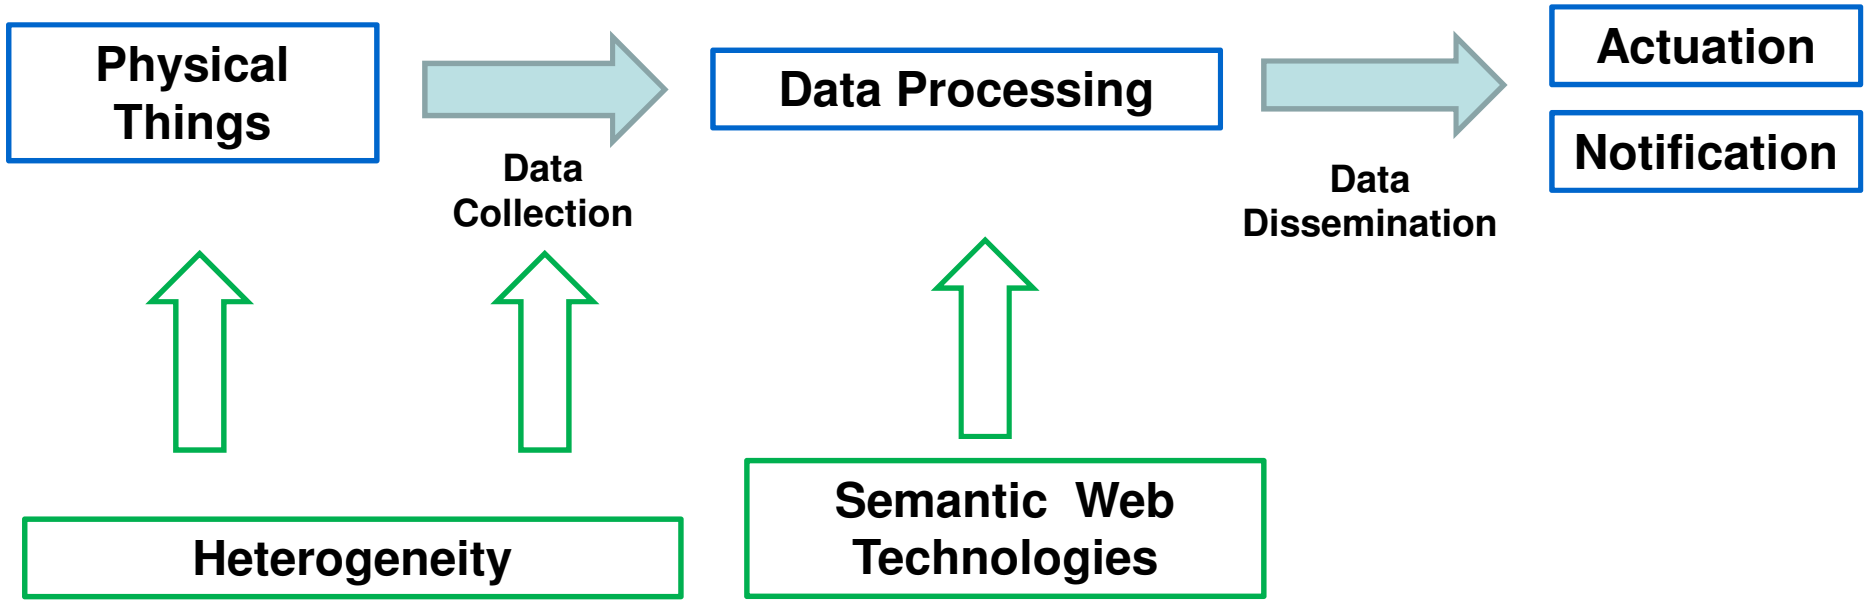
Roadmap

- Introduction
- Challenges
- State-of-the-Art
- Horizontal IoT application development framework
- Conclusion

Challenges

- Connecting heterogeneous things
- Combine data from different sensors and domains
- Uniform representation, treatment and interpretation of sensor data for cross domain applications
- Uniform application development framework for any “horizontal” scenario
- Deploy across multiple platforms (cloud, home gateway)
- Derive actionable intelligence allowing humans or things to react
- Support resource discovery, automatic management, provisioning while maintaining interoperability
- Preserve privacy through secure mechanisms

Solution: Semantic Web Technologies



- **But semantics alone is not sufficient**
- **Still need components for**
  - Resource discovery, provisioning, automatic management of things
  - Deployment platform, support for actuators

Roadmap

- Introduction
- Challenges
- State-of-the-Art
- Horizontal IoT application development framework
- Conclusion

State-of-the-Art

- **The reasoning engines and semantic algorithms in a mobile app are largely based on internal sensors.**
  - No consideration towards external sensors (deployed in smart home).
  - No dynamic discovery of sensors.
- **Current initiatives are largely focused on domain specific scenarios.**
  - What about cross-domain (horizontal scenarios)
- **Interoperability issue**
  - No common catalogue exists for sensors, measurements, units, and domain names.
- **Not oriented to a standard**

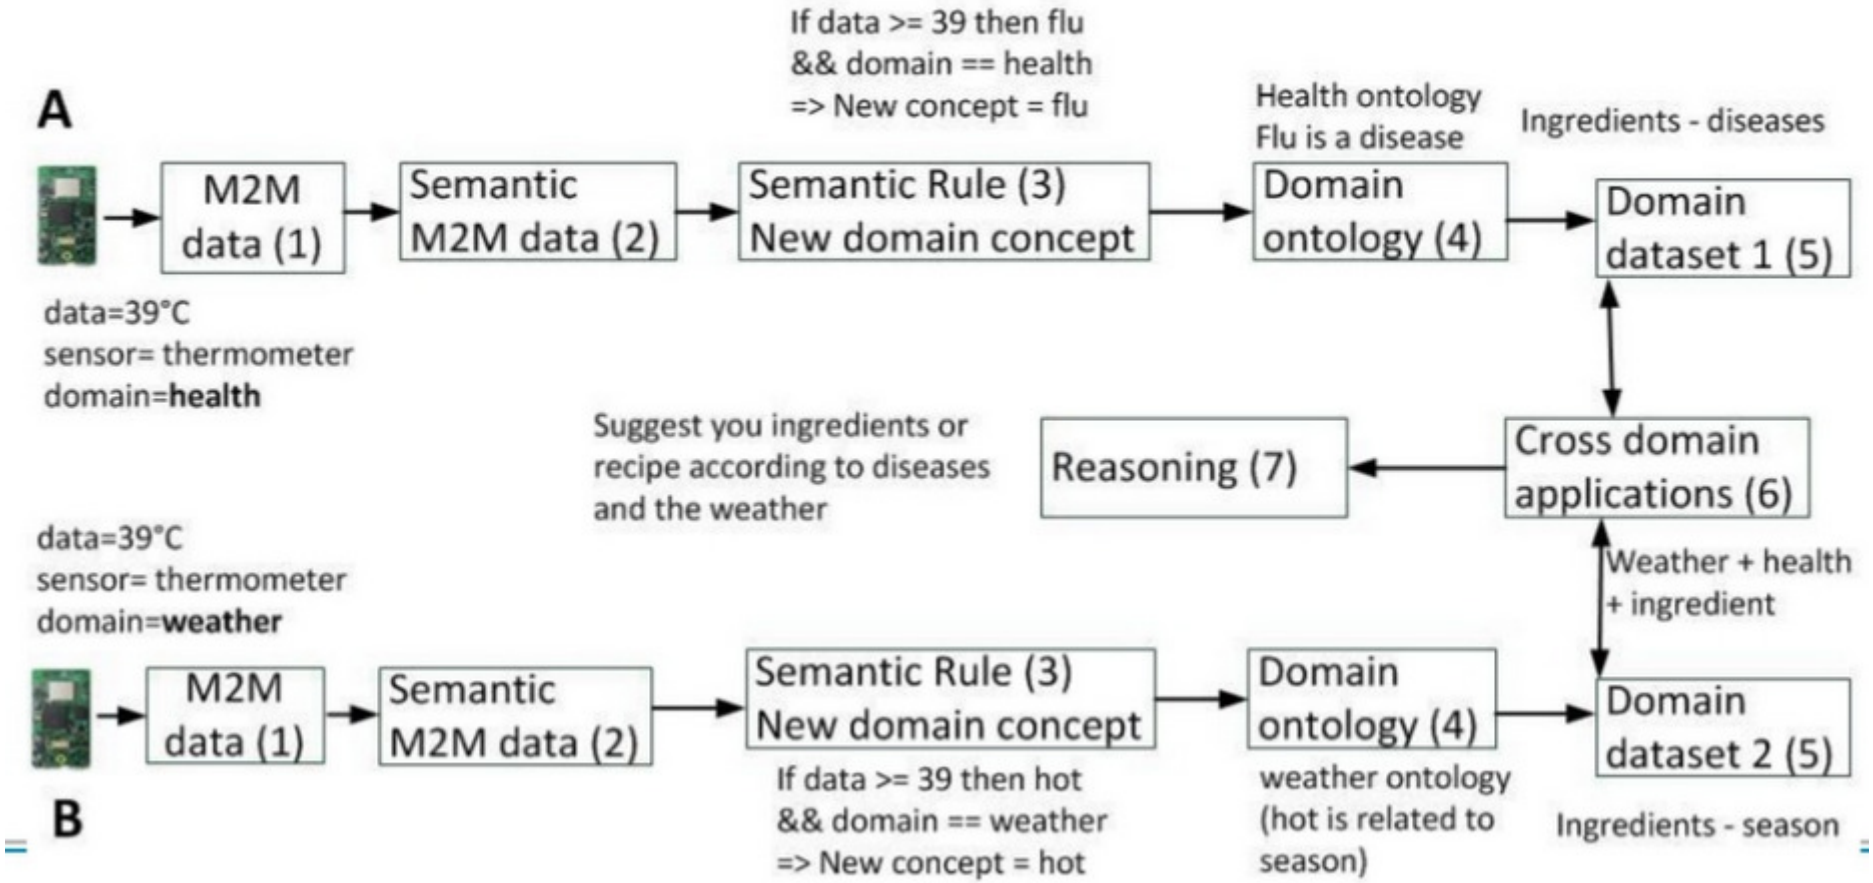
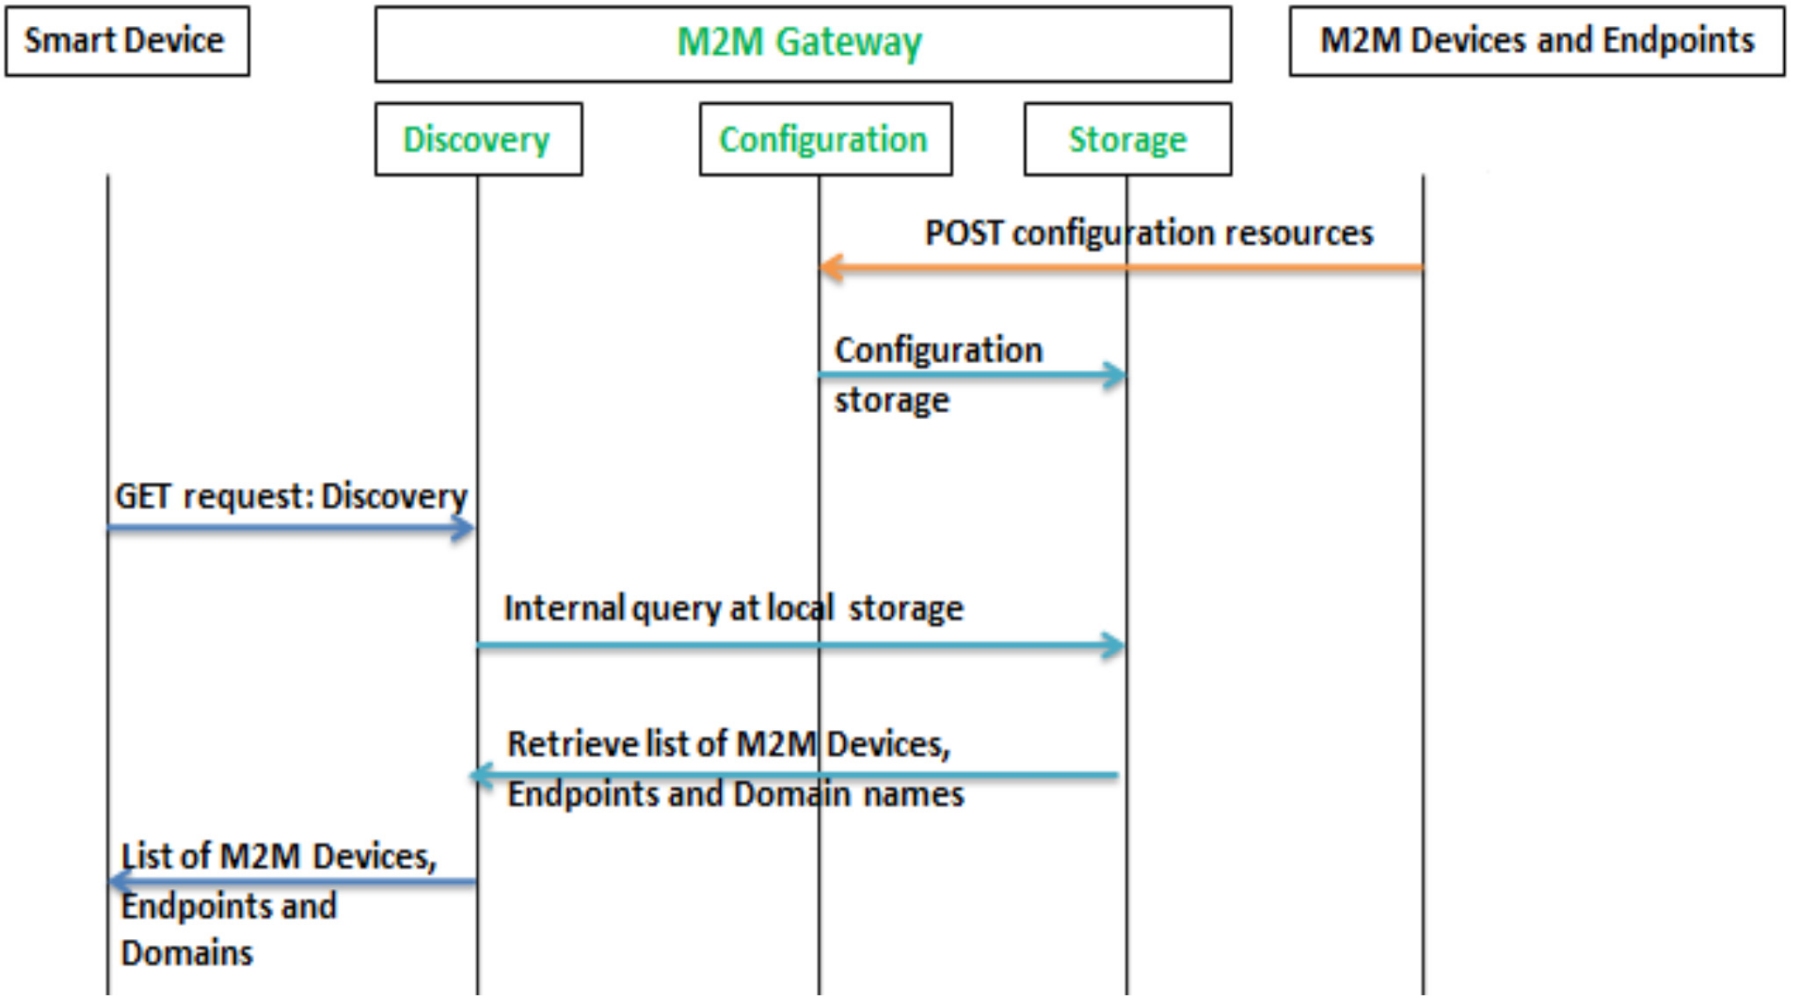
Semantic Reasoning

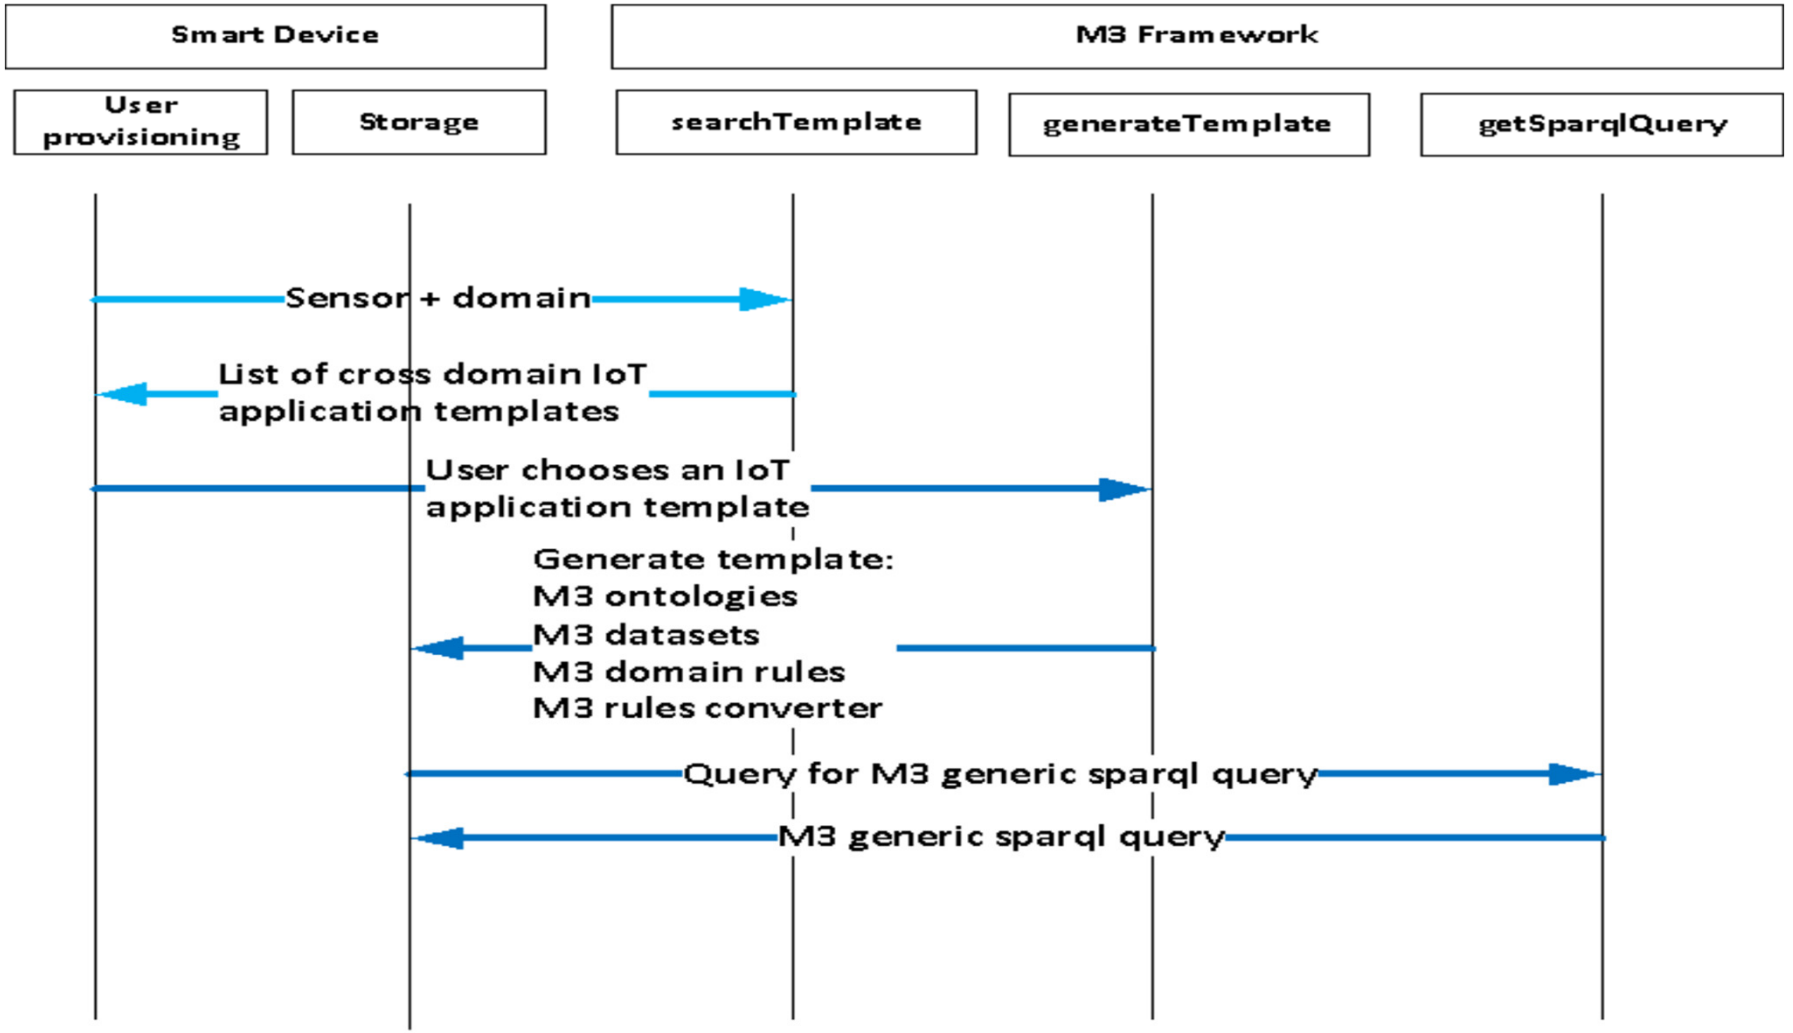


Source: Gyrard, A.; Bonnet, C.; Boudaoud, K., "Enrich machine-to-machine data with semantic web technologies for cross-domain applications," in *Internet of Things (WF-IoT), 2014 IEEE World Forum on*, pp.559-564, 6-8 March 2014

Discovery Phase

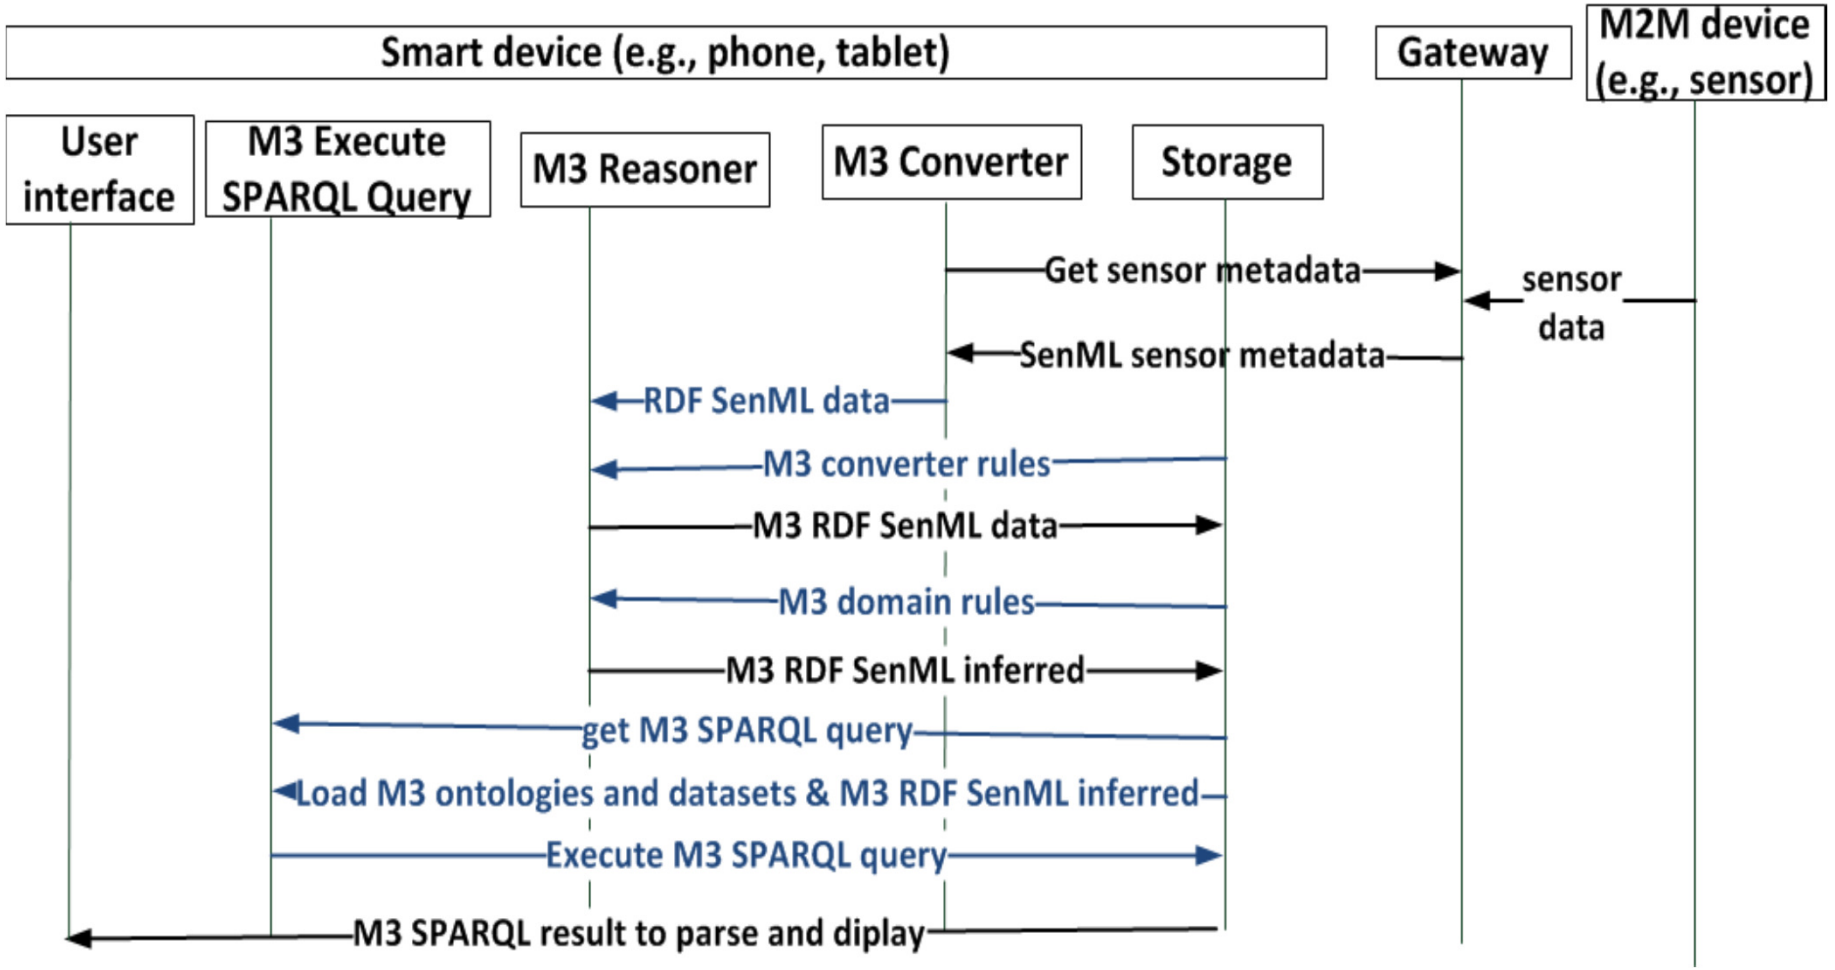


Provisioning Phase



EURECOM

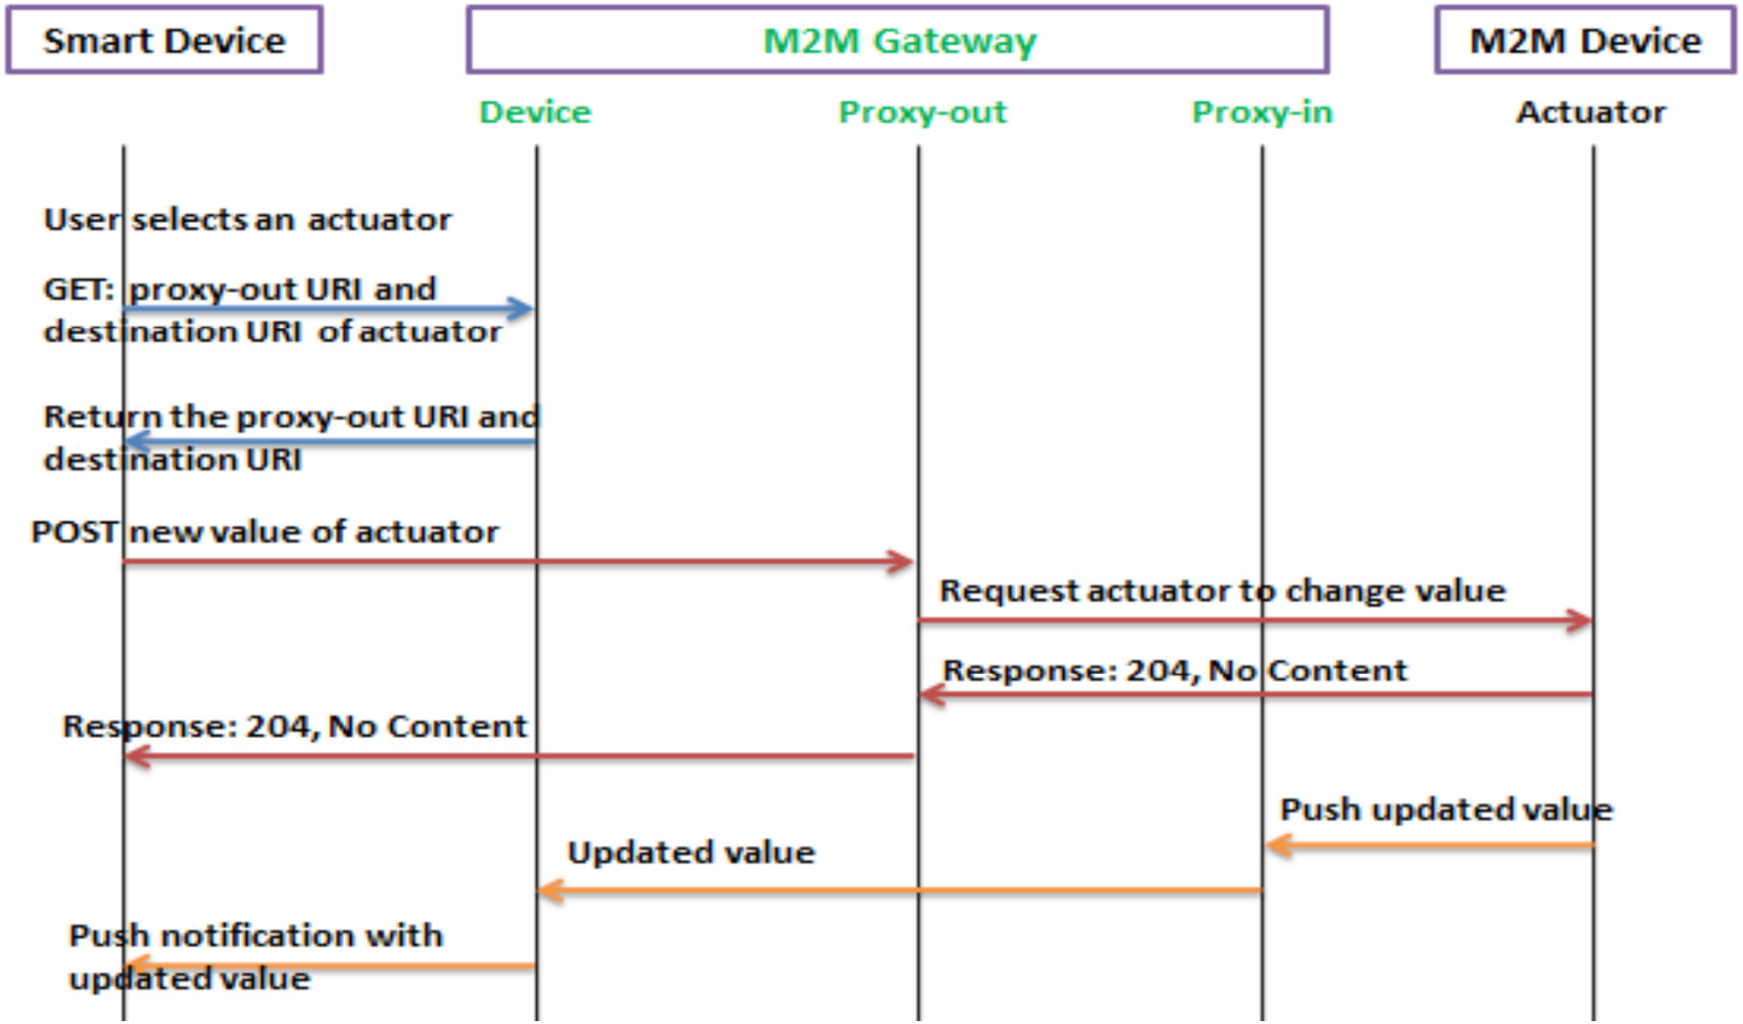
Convert, Reason and Query Phase



Data Dissemination Phase

- **Based on HTTP GET**
  - Consumer mobile phone request for actionable intelligence from Middle Node.
- **Based on Push notification**
  - Middle node uses Google Cloud Messaging platform to push actionable intelligence into Android powered devices.
  - Apple Push Notification platform is used for iOS powered devices.

Actuation Phase



EURECOM

Deployment and Prototype

- **M3 Framework – Cloud**
  - Developed using Jena Framework
  - Available at - http://sensormeasurement.appspot.com/
- **Cross domain IoT application development framework – Android powered device acting as a home gateway**
  - Developed using Android SDK and AndroJena
- **Initial testing performed with**
  - Combining weather and vehicular sensors data
  - Combining eHealth and home automation sensors data

Roadmap

- Introduction
- Challenges
- State-of-the-Art
- Horizontal IoT application development framework
- Conclusion

Conclusion

- **In a nutshell,**
  - Challenges towards horizontal IoT application development framework in smart home
  - Limitations found in state-of-the-art
  - A semantic based framework for such development and its deployment

Acknowledgements:

1. The M3 Framework has been developed and maintained by Dr. Amelie Gyrard.
2. This work is supported by the Com4Innov Platform of Pole SCS and French research projects WL-Box and DataTweet (ANR-13-INFR-0008).

Sometime Soon …
